

Clean Libraries

Every Dependency
Deserves a Trust Decision

The Modern Dependency Challenge

Every application depends on libraries introduced from multiple sources. They enter your software supply chain through developer choices, AI-generated suggestions, or transitive dependency resolution, often without anyone verifying their source, provenance, or trustworthiness.

DEVELOPER ADDED

OPEN SOURCE

AI INTRODUCED

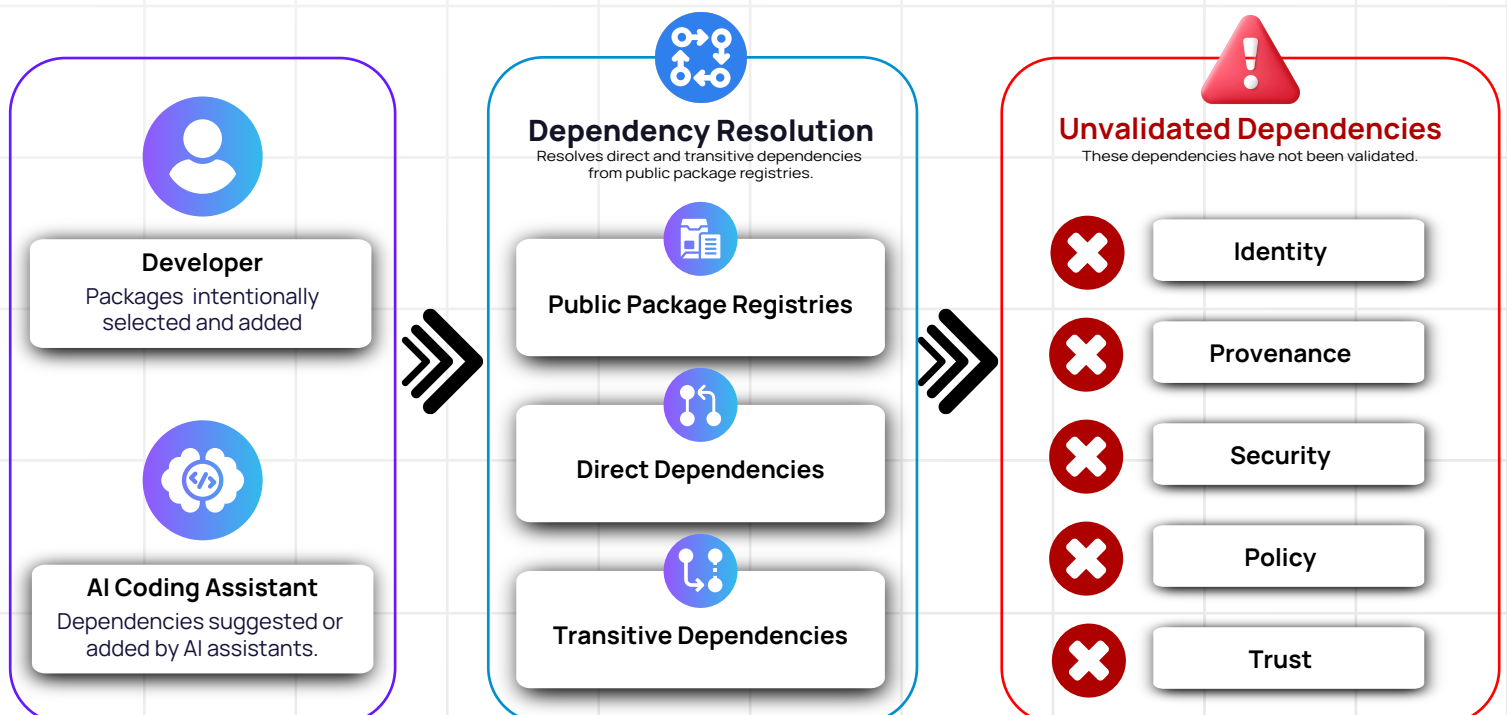

TRANSITIVE

Every dependency becomes part of your software supply chain.
Not every dependency should become part of your production software.

The Unvalidated Dependency Problem

Clean Libraries Built from Source

Source Built

Every library is built directly from the upstream source before it is made available.

Transparent Provenance

Every library includes verifiable origin, build process, and integrity information you can trust.

Continuously Revalidated

Libraries are continuously verified as upstream projects evolve to ensure ongoing accuracy and security.

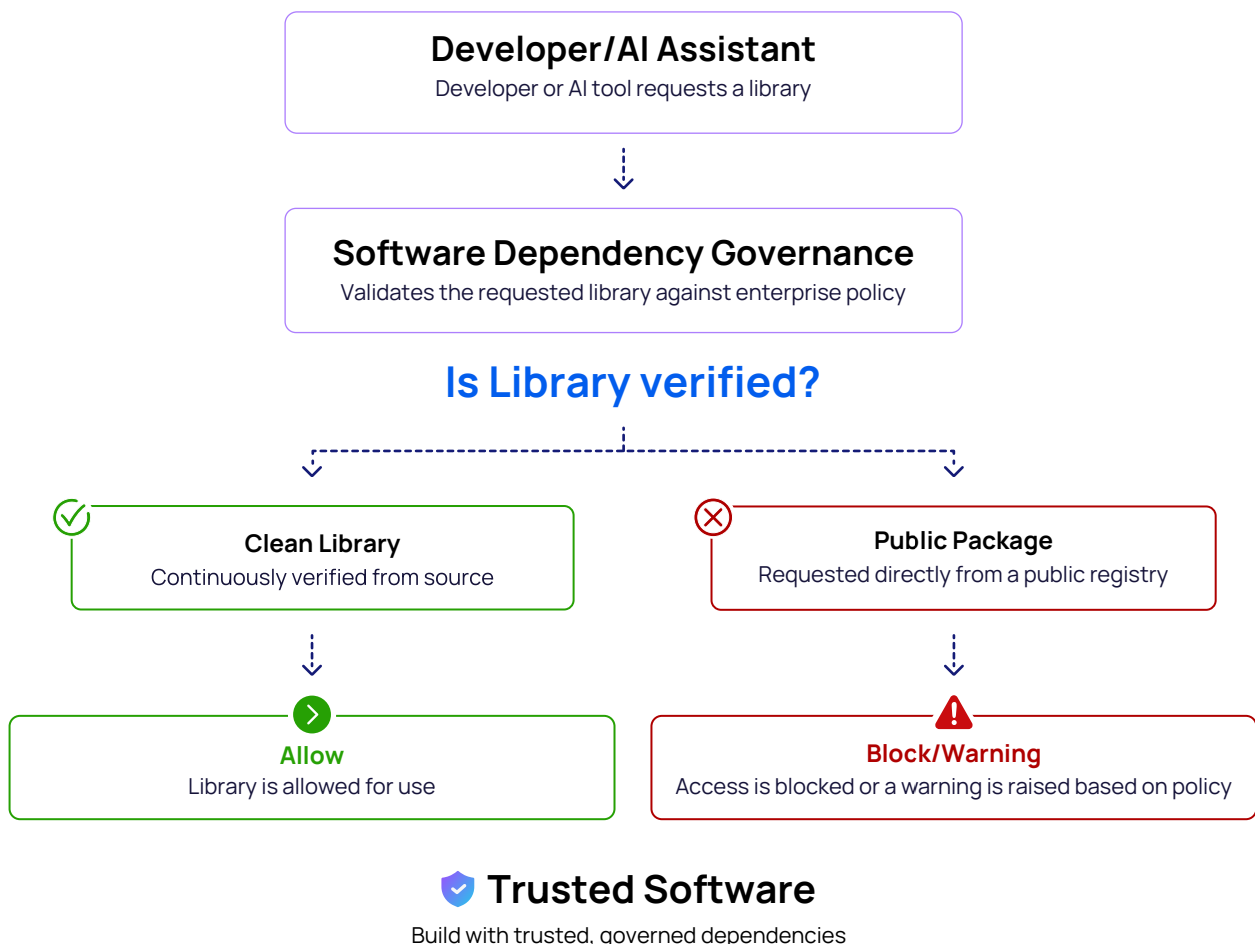

Trusted for Enterprise

Validated libraries ready for enterprise development and secure software delivery.

Consume verified libraries instead of relying solely on unverified public packages.

Software Dependency Governance

The policy engine that determines which libraries can be consumed.

Verified Libraries . Governed Consumption . Trusted Software

Modern software is no longer written from scratch. It is assembled from thousands of dependencies introduced by developers, AI coding assistants, and automated dependency resolution. Every dependency is a trust decision.

Clean Library ensures those trust decisions are made before code reaches production. Every library is built from source, continuously verified, and governed by enterprise policy, enabling organizations to build trusted software with verified dependencies.

**Every Dependency Deserves a Trust Decision.
Every Application Deserves Trusted Software.**
